FINAL REVISIONS COMPLETION FORM

Capstone Project Title	**A CENTRALIZED SCHOLARSHIP MANAGEMENT AND TRACKING SYSTEM FOR BULACAN STATE UNIVERSITY – BUSTOS CAMPUS**
Group Leader	**Santos, Tristan Joseph M.**
Group Members	**Dela Cruz, Emerson DC.** **Valderama, Ian Harold DR.** **Victorino, Veejay S.** **Villarama, Johnvher S.**

1	**Dr. Jennifer P. Solis**	• Basic validation, verification, and record matching that are necessary to achieve Objective No. 2 should already be implemented • Provide test cases showing student-record validation, duplicate detection, and prevention of multiple active scholarships • Provide test-case tables and explain their results • Describe how matching works, not merely where the algorithm is used. Explain why that algorithm was chosen • Show what happens when a student with an existing scholarship tries to apply elsewhere • Add a way to upload records from outside providers, such as local-government scholarships, and use them in comparison	• Implemented exact identity checks, weighted duplicate matching, and scholarship conflict checks based on the academic cycle. Added explanations of these mechanisms in the paper. • Prepared matching tests and documented isolated database test cases covering identity verification, conflicting scholarships in the current academic cycle, previous awards, pending applications, external scholarship records, authorization, and rollback. • Added test-case tables for the core system and document processing, along with synthetic document extraction results. Explained the observed limitations and clarified the difference between passed test cases and field accuracy. • Added code snippets and explanations for the Levenshtein Distance Algorithm, Weighted Record Linkage, and Rule-Based Decision Tree, including how they work and their purposes in the system. • Prepared a test video or step-by-step demonstration showing how the system detects an existing scholarship and prevents a student from applying for a conflicting scholarship. • Added Internal and External grantor classifications and an authorized process for importing official scholarship records. Imported records are checked for matching identities, recognized scholarship programs, academic cycles, and existing awards. Clarified that external scholarships can only be detected if their records have been entered into the system.	
2	**Dr. Romel S. Pabustan**	• Revise the flowchart by using connectors consistently, simplifying	• Simplified the flowcharts by using consistent connectors, clearer processes, and appropriate ending paths. Organized the diagrams	

No.	Panel Name	Comment	Action Taken	Signature
		the diagram, and showing appropriate ending paths. • Explain the security measures used to protect sensitive information and uploaded documents. • Improve the protection of downloadable scholarship documents by considering additional security layers, such as password-protected PDFs • Explain the algorithms used in the system, their purposes, and the processes where they are applied • Use measurable performance and accuracy metrics to support claims about the algorithms' effectiveness	according to their specific workflows. • Expanded the security discussion to explain authentication, authorization, private document access, sensitive data protection, session controls, audit records, and secure downloads. Also clarified the limitations related to malware scanning, document retention, and backup and recovery. • Implemented AES-256 encryption for student PDF download copies using newly generated 24-character passwords while keeping the original documents unchanged. Added optional six-digit MPIN verification. Authorized staff downloads follow separate role-based access policies without additional file encryption. • Added code snippets, formulas, and explanations of the algorithms used in the system, including weighted scholarship recommendation scoring, duplicate-record matching, scholarship conflict validation, and COR/ROG document processing. Explained their purposes and how they work. • Added a field-accuracy formula and documented the results of synthetic COR/ROG testing. The tests correctly extracted 16 out of 16 COR fields and 9 out of 9 ROG fields across three text-based PDF documents.	
3	**Dr. Anthony U. Concepcion**	• Reorganize Chapter IV according to the study's specific objectives, clearly presenting the corresponding findings, results, and discussion for each objective. • Explain how the system can accommodate future changes, including additional grantors, scholarship requirements, features, and processes. • Clarify how the client can continue operating, managing, and expanding the system after the original researchers leave	• Reorganize Chapter IV by specific objectives. Expanded Chapter IV with system interfaces, validation discussion and test/evaluation results, and aligned Chapter V findings with the objectives. • Explained future grantors, requirements, features and processes. Implemented configurable grantor/scholarship records, documentary requirements and academic-cycle controls, and described the client-server architecture and future expansion. A dedicated explanation of how new grantors, requirements and process changes are configured • Explained client operation and continuity after turnover. Prepared repository/deployment guidance, workflow documentation and a manual Storage-backup utility, and identified security/recovery work for future maintenance.
