We are now ready to answer your questions. Ready to answer, ready to answer. Good afternoon again.

So let's proceed to the question and answer and recommendation of the panel. So let's start with Dr. Romel. I'm taking your flowchart.

Where's your flowchart? Here, I already attached the connectors. Leave it here. Here are the connectors.

And... Use a connector. It's not consistent. Others have a connector.

I don't have one. Then, simplify it. If possible.

Then, the end. There are processes that end directly, right? But in your flowchart, there's none. There's only one end.

There are processes that can end, right? Yes. Put a connector. Then... This is not consistent.

I hope there's none. I'll go back to the system. How do you protect sensitive information? So, in the password, we'll encrypt it using the SHA-256 encryption.

And we have an email confirmation before the student creates an account to know that this email is correct and valid. Is that included in the test case? What do you consider as sensitive information? How do you protect it? And you mentioned an algorithm. Can you tell us what that is? We have three types of algorithms.

The first one is to create an account for the student. We used Levens Time, Distance, and Similarity. The second one is to detect duplicates of records across the mograters.

We used Weighted Record Leakage. And for the recommended scholarship, we used Decision Break. Let's go back to the sensitive information.

One of our sensitive data in the system is the password and the user ID. That's all. How about the document itself? Is that sensitive? Yes.

Scholarship documents. What about the student application profile? The student application profile is already in our system. How do you protect it? Is it just the password? I mean, is it just the password? Yes.

How do you protect it? Are the files downloadable? Yes. In PLDD, if you download a PDF file, there's a password. If you download it, there's a security layer.

How about you? How do you do it? Do you have a security feature to protect it? Because it's a scholarship. No. Do you have one? No.

No. No. No.

No. No. No.

You can improve it next time. Okay. Then, I'll show you the security media.

These are your documents. You put something here. CSB.

Protect CSB export. You said there's nothing. You put something here.

Formatting PDF file. CSB. You convert it to CSB.

Sir, that's for exporting to Excel file. That's for the report generation. We're just testing if it works.

What do you think? All of these have a password. What else do you notice during your testing? One of them is the cyber attack. Gruntor account, sir.

What's that? It's prone. It's prone. It's prone, sir.

I can't say brute force because we have three attempts. Three attempts. I think, sir, it's the request injection.

SQL. In the middle. In the middle.

From server. Because we have a server. So, there's a request.

Then, we can inject it to our system. So, that's what Gruntor sees. All accounts, sir.

All of them. Okay. Thank you.

Thank you. Good afternoon, everyone. Good afternoon.

Again, congratulations for your presentation, Ian. I would like to commend also the name tags. Yes.

They are themed with your presentation. He mentioned that because we are busy, right? Yes. That part is very good because we are busy despite our heavy schedules.

Okay. So, I would like to start with the number two for our specific objectives. I would like to see in the system, how do we validate the student record? As well as, how do we prevent multiple active scholarships and also duplication? So, provide a test case.

Or if we can show it, what is that scenario? My objective number? Yes. My objective is to validate

student records. Show all of that in the system.

Okay. So, to validate the student record, the admin can see the document uploaded by the student in the creation account. There.

So, the admin can see and validate the student record. This is manual. Manual validation.

Manual validation. We have automatic validation in the creation account. So, when the student uploads his COR, or in this case, the COR.

Then, he uploads his ROG. So, this is where we validate the COR. This is the student number.

This is the student. This is the ROG that I uploaded. Now, how can you prove 100% the comparison, the accuracy of getting the student number from the COR? COR.

To the records from the database? How accurate? The image is correct because you uploaded an image. PDF. PDF.

So, how accurate? Because the 7 might be 1. The 7 number. Yes. Because it's a PDF.

So, how accurate? Do we use an algorithm for this? Yes. The algorithm will check for the data, not the image itself. So, the text data.

So, when the algorithm checks for the text data, it converts it to a string. Then, it will check into the system if that student number is in the records. Exactly.

My question is, how accurate is it? Because not all the time, it's clear that you'll get the PDF. Right? He took a picture of an image. The accuracy, how can you prove that accuracy? This algorithm is very good when it comes to capturing the text from the PDF file.

To be honest, ma'am, I can say that 1 out of 10 are the accuracy of the system is good. How many times did you test? We tested multiple times. So, I can say, ma'am, about… Yes, ma'am, what did you test? What did I say? What did you test? It's good that he's not here with us.

If I remember correctly, I called him earlier. Gab? Yes, they were together. They're going back.

We tested multiple times. We have a test master. Wow, test master.

Because there's a test master, he can look at the documentation as a tester. So, we tested multiple times. I can say, ma'am, confidently, 30 plus.

30 plus. Okay, come, please. I do believe that you did it.

30 seconds. We performed all of this. But where's the documentation? Do we record all of these? Yes.

Those were discussed here in the document? Yes. Those were discussed here in the document? Yes or no? Those were discussed? Test case is a table. That's a table.

Were you able to discuss? Yes or no? Yes, ma'am. Can you take a picture of this? Yes, ma'am. Okay, ma'am.

There's a copy. What's the page number? Wait a minute, ma'am. I have no idea.

No, ma'am. There's still an interval, ma'am. Because you asked for a review from Ma'am Tess.

30 plus. Yes, ma'am. That's really true.

That's really true. She tested a lot of times. Because of Ma'am Tess.

Because of Ma'am Tess. Like about four times, ma'am. Just four times? Why did you say earlier? It's about 30.

Page 41, ma'am. 41. Not the whole documentation, ma'am.

Oh, my. Like a short summary, ma'am. I just briefed it to Ma'am Tess.

41. That's table 1, ma'am. That's it, ma'am.

Ma'am Tess didn't get it right because there are too many test cases, ma'am. It's just a description. That's what Ma'am Tess is looking for.

Because that is very important in matching. Because first of all, let's start with the algorithm inclusion. It's very good that we have three.

That's okay. But then, in the documentation, it's just stated where you used it. But the implementation is not recorded.

Tristan told us earlier how you did it. But when you put it here, you said that you were able to do it. Yes, on the part of uploading, creating accounts.

It's that simple. But it's like magic. It's matching.

It's checking. But there's really no discussion about that. That is very important.

Because you used it. The implementation is not recorded. And at the same time, you were able to test if it's really accurate.

Because there are a lot of algorithms. But you chose the difference time, right? Yes, ma'am. But what made you choose? Because you saw it, you searched it once, that's it.

There's no basis on why we chose that. Oh, okay. You used the matrix to say that it's accurate.

Correct. It's measuring accuracy. It's the matrix.

Okay, thank you. Okay. Then you mentioned about centralizing.

Centralizing in what aspect? What is the scope of the centralization of this document? What covers the centralization? It's a difficult question. Right? Okay. How does it take on scope? The title.

I can say that it's centralized, ma'am. We are the centerpiece of the system. It manages the student and grantor's transactions.

If it's admin, then everyone who has an admin should be centralized, right? Right? Because you said you have an admin. That's the reason why it's centralized. Actually, I didn't... Please identify why it's centralized.

What does it cover in the scope of this centralization? There. Next. You know, accurate.

Algo, test case for preventing. There. How do we prevent? You're not done with the other one.

We're still in the validation. Yes. Okay.

After validating is multiple active scholarship. How do we prevent this? Here. either... On the grantor's side, the grantor can upload a scholarship, a sample scholarship data list.

Then, we can detect if these students are already on the record or already on the record of other grantors. That's how it is. But the student can apply if he's already applied.

Currently. Then, he can still apply. No.

That's how it is. That's how the validation is. So, we prevent.

How many grantors do you have? Now, two. Two. We should have a lot of grantors.

For example, I'm already a scholar here. I'm still applying. That's what I'm telling you.

Yes. We're going to test what you're saying. That prevention.

How can we test if our data is not enough? So, now, ma'am, you can see that this student has a scholarship from this grantor. So, he can't apply to another scholarship like this one. Yes, I'm new here.

So, he can't apply here. He's locked in for this semester. I mean, for this scholarship.

So, once the students have completed requesting for materials, that's where we base it. When he requests for materials, then, the scholarship of the students will be locked to him. But, outside of this, what will he do? If the student doesn't declare that he's a scholar to others, he didn't get the

scholarship from others.

For example, he's a mayor. How is that? That's it. We can't control if the students apply to others.

Because, in other places, they can apply for a second scholarship. We can't control that. That's one of our limitations.

So, we can only keep the scholarship of the grantors. That's the only way to prevent duplications. So, it should be centralized if we can ask for a list.

For example, to Quentin, he can list the scholarship holders to include them. Then, they can't apply to others. There's a way, I think, to do that.

It should be centralized. That's not the answer. It should be centered to Celsa.

That's their explanation. Actually, what I'm asking you to do is to control so that we can identify and prevent duplications of scholarships. Sir, even if you don't apply there, the list of the grantors should be kept.

Let's do that so that we can have a data sheet. The scholarship holders should have a data sheet. They should have one.

They have a lot of collections. They don't study. That's it.

We should have an upload to the panel. Can we add? Yes, to the admin side. We'll upload a list from outside that we don't cover.

That will be also part of the threshold of duplication. Here, to the admin, if the client holds the records, that's the only thing he can upload. That's why I'm telling you that we should have an extra... That's one of our limitations.

Not anymore. You need to include it to be centralized. We'll get all the possible scholarships.

We'll get the database of the scholarship holders. We'll upload it to be a point of comparison if they already have a scholarship outside. If they already have one, they are not the priority for the scholarship inside.

Do you have a record? Of course not. I have a record. It's important to have a record.

If we say centralized, what's the process? What's the concept of centralized? Because if you have a database, as Dr. Jean said, upon uploading your COR earlier, you won't be able to access it. Meaning, your system will read that you already have a scholarship. Because if it's inside, it can be prevented by Sir Celso if there's duplication.

He'll just check if there's a list here. He won't allow it. He won't sign it.

Even our administration in Maine monitors that. If it's only inside, duplication can be prevented. Because there's data inside.

Because the data is inside. You won't be able to see who's the partner of the scholarship. For example, Senator Wynne.

Can you see that it's duplicated? Not even in the manual. Because they have data inside the university. Okay.

Let's add Explain the process of pre-approved validation. Is that it? Pre-approved validation. May I have this? I don't know about you.

You said you have pre-approved validation. It's in your documents. What are you asking us? You said pre-approved.

Pre-approved validation. Pre-approved validation. Here in the tracking section.

I can answer all of that. Tristan is increasing. Is this manual? Yes, it's still manual.

But it's in the system. So, pre-approved. Before the student can continue the process, the admin can check the student's documents.

Pre-approved. Does it apply? Yes, it does. It's in the application table.

It can also be in the grantor. It's in the application section. It can be checked here.

How? For example, if you have something to check, how? Here, in the review. Here, in the review. Here, the student can see the details of the student.

Here, he can see the steps. Here, he can see the documents that the student has read in the system. What specifically are you checking? Requirements.

Like what? COR and ROG. Those two. Indigency.

Also, for example, short essay. Handwritten short essay. They can upload the JPEG file or PNG.

Okay. For my last question, can you check the recommendation in the slides? I don't want to disagree. I'm sorry.

In the recommendation. There. Can you read number one? It should not be there.

It should be part of your system because that's your system and part of your objective number two. Okay. That's good.

That's basic. Okay. That will be all for me.

Okay. First of all, congratulations on your presentation. Thank you.

In chapter four, please organize your chapter four based on your objectives and answer your objectives. I can't see it. It's separated again.

For example, objective number one. You always say that. Objective number one.

What do you mean by objective number one? Okay. Then, another question. This is also my question to all those who defended.

Is the system can be expanded in the future? And how? Yes. For future researchers, it can be expanded. How will it be expanded? For example, you left it to Sir Celso.

Okay. So, you're not here anymore. How will Sir Celso use it in the future? Like for example, there are added features or processes in the scholarship.

There are added grantors and so on. Yes. if the grantor or the admin or the client he can create a grantor's account.

So, in grantor management, I think in the grantor's, there is an added partnership of grantors in Bustos Campus. Okay. Sir Romero asked again how will it be protected? What are the sensitive data? So one of our sensitive data, sir, is the student ID because student ID is a unit ID.

The COR and the student, all the documents for the Pinasan student. It's okay now. Okay, so the other student cannot see my documents, but only the admin and the grantor.

Okay, thank you. Okay, you can leave now. Thank you so much.

You're welcome. Thank you. You're welcome.

John, I thought you were going to answer. I was so surprised. Where's the password? Password? The application form.

I thought you were going to read it. No, I was just thinking that there's security here.
